Objective: Transanal endoscopic microsurgery (TEM), a minimally invasive technique has been employed in the excision of benign and well-selected malignant rectal tumours since June 1998. We present a prospective descriptive study and analyse the currently accepted indications. Patients and methods: Over a 4-year period 100 patients underwent TEM for treatment of rectal tumours located between ...

Anastomotic leakage (AL) is one of the most severe early complications after rectal cancer surgery. Many studies and meta-analysis results show that the indentation of transanal drainage tubes (TDT) can prevent and reduce the incidence of AL. However, the size and material of drainage tubes are rarely reported. Herein, we compare the effect of three kinds of TDT and analyze the use of TDT ...

(TAMIS), which can provide high-quality local excision for rectal neoplasia, has emerged as an important alternative to transanal endoscopic microsurgery. The role of TAMIS beyond local excision has also been explored, and it has been shown that this platform can be used for complete rectal resection with total mesorectal excision (TME).

## **Overview | Stapled transanal rectal resection for ...**

Brief Summary: The stapled transanal rectal resection (STARR) has recently been recommended for patients with obstructed defecation syndrome (ODS) caused by rectocele and rectal wall intussusception. The aim of STARR is to correct the mechanical outlet obstruction using a stapler device for endorectal resection of the distal rectum.

Stapled transanal rectal resection (STARR) Obstructed defecation syndrome (ODS) can be caused by structural deformities in the rectum resulting in chronic constipation. STARR can treat ODS using minimally invasive methods. STARR is a surgical procedure that is performed through the anus, requires no external incisions, and leaves no visible scars.
