Classical Electrodynamics is one of the most beautiful things in the world. Four simple vector equations (or one tensor equation and an associated dual) describe the unified electromagnetic field and more or less directly imply the theory of relativity. The discovery and proof that light is an

D.J. Griffith's Introduction to Electrodynamics must be mentioned. To my knowledge this text is ubiquitous in junior-level E&M courses. The writing is extremely friendly and is excellent for self-study. The author frequently tells you what he is doing and provides motivation, unlike the ubiquitous graduate-level text by Jackson.

You could study from Jackson and get a bit out of it this summer, but no way you'll "work through it" in three months, there's far too much for that. (Also, the problems tend to be somewhat on the difficult side.) I can suggest a more helpful approach, though: get Griffiths' book, which has much more in it than a one semester course could cover (MIT excepted).
