Now, this is where the information from Yamaha starts to get woolly. Exactly how the Formant interacts with the Voice/Noise Operators hasn't really been described by Yamaha in their manual. I know it's a bit technical, but if you want to be able to create your own sounds from the lowest level up, you need to know this information.

DX7 aficionados will like the fact that the FS1R has almost complete compatibility with 6-Operator FM synths: you can send, via MIDI, a patch from a DX7, for example, and the FS1R will convert it to an identical-sounding patch in the new synth. A lot of the preset Voices actually come from the DX7's library.

Hi, I also would love a FS1R editor in CTRLR because I actually made two incompleated editors for it : one for JSynthlib and the other for Mac, but actually I'm on a PC so I can't develop anymore on Mac, and JSynthlib is a bit ugly. The Mac version is here. Currently I don't understand many things in CTRLR and the documentation is hem lacking a reference, so I'm tedious to start one.

The FS1R actually takes FM synthesis to new levels of musical versatility and control. Unlike Yamaha's original FM synthesizers and tone generators the FS1R provides a range of 88 algorithms to choose from, and a choice of 8 different waveforms for each oscillator, thus significantly expanding the range of sound which can be produced.

You can do a LOT with sine waves, but the FS1R also has a set of complex harmonic waveforms to add to that. It has all of the Yamaha FM-X waveforms which include the All1, All2, Odd1, Odd2, Res1, and Res2 waveforms. Just one FS1R operator using one of these waveforms can replace an entire stack of DX7 sine wave operators.
